Problem

Utility and street works can quickly disrupt footpaths and pedestrian routes. Traditional trench coverings can be heavy, awkward to position and create additional changes in level around the excavation. In busy urban areas, maintaining safe and accessible pedestrian movement while allowing work to continue is essential.

Risk

Poorly protected excavations can create trip, slip and fall hazards for pedestrians and wheelchair users. Heavy steel covers also increase handling risks for crews, while disruption to footpaths can affect residents, businesses and everyday pedestrian movement.

Solution

The LowPro® 11/11 is a lightweight composite trench cover designed specifically for pedestrian applications. Its 17mm ultra-low profile, integral slip-resistant surface and patented LowPro® Edge help create a stable pedestrian route with minimal change in level.

At just 25kg, the cover can be installed by one person without heavy lifting equipment. Together, these features help provide a practical, low-profile solution for maintaining pedestrian access around temporary works.

Reusable, durable and rigorously tested, the LowPro® 11/11 provides a proven solution for utilities, telecoms and contractors working in demanding urban environments.
