

44 TONNE

rated composite road plates for safe traffic management over excavations.

Oxford
WE'VE GOT IT COVERED

Heavy-Duty Excavation Road Plates Lightweight Installation

Supporting 44t vehicles over excavations during temporary works

Fast Deployment

Quick to install, remove and reuse.

2 Person Installation

No crane, HIAB or heavy equipment.

Load rated

Built for heavy vehicle drive-overs.

Anti-Slip Surface

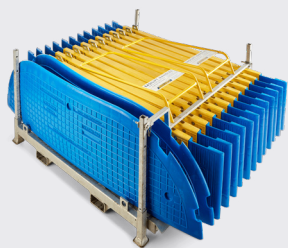

Designed to improve safety.

Trench Cover

Maximum Trench Width 48"

LowPro 23/05 & 15/05 Road Plate System

Product in Action

Problem

Utility and highway works often require excavations to remain safely accessible to traffic. Traditional steel road plates are heavy, difficult to transport and typically require lifting equipment for installation and removal, adding cost, complexity and programme constraints.

The handling and positioning of steel plates can also introduce significant safety risks for site teams, while vehicle movements over steel plates can generate noise that disrupts residents and businesses.

Risk

Poorly managed excavations can lead to traffic disruption, project delays and increased safety risks for road users and operatives. The use of steel plates often requires specialist lifting equipment, additional personnel and extended road occupation times, increasing both operational costs and exposure to risk.

These challenges are amplified in urban environments, narrow streets, historic town centres and restricted-access locations.

Solution

Designed for rapid two-person installation, the modular anti-slip system eliminates the need for cranes and lifting equipment, reducing both installation costs and manual handling risks. Contractors benefit from faster deployment, reduced road occupation times and improved safety performance, while maintaining safe traffic flow over excavations.

The composite construction also delivers a quieter solution for urban and residential environments, helping to minimise disruption from passing traffic.
